Requires Changes

1 SPECIFICATION REQUIRES CHANGES

Design

The page at minimum includes all of the following:

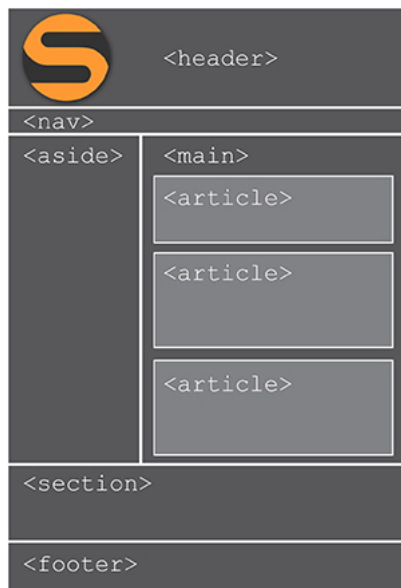

- at least 4 images
- title text (h1, h2, etc.)
- regular (paragraph) text
- a logo.

HTML5 semantic tags such as `<header>`, `<footer>`, `<article>`, `<section>` etc. are used to add meaning to the code.No `<div>` or `<section>` tags are without a `CSS` class or id.Check out the W3C documentation on [HTML Structural Elements](#) to learn more!

App hasn't used HTML5 semantic tag to define page landmarks.

- Semantic tags allow browser to understand the structure of our HTML document.
- Assistive technology (for accessibility) also make uses of semantic tags to aid user with inaccessibility to use the website.
- Search engine also read semantic tag to better understand the page content
- (etc.)

Here's a diagram I created to demonstrate a basic typical *semantic* layout:

Please also see [MDN doc](#) for a full list of semantic tags.

Reference

- See this [Stackoverflow answer](#) on why use html5 semantic tags

Provide at least one of the following customizations:

- Customize images and text.
- Customize placement of the elements on the page (grid layout) with `HTML`, `CSS` or both.
- Customize `CSS` styles applied at minimum to paragraph and heading elements.

Page utilizes a grid-based layout with styles making use of the `flexbox` layout or a framework like `Bootstrap`, `Foundation`, etc.

If you're using `Bootstrap` or standard `HMTL/CSS`: the rows and columns of the grid must be wrapped in an element with a `container` class.

Flawless! The Bootstrap grid layout is correctly implemented! 🌟

Responsiveness

All content is responsive and displays on all display sizes. This includes:

- Desktop
- Mobile: Google Nexus 5
- Tablet: Apple iPad

An image's associated title and text renders next to the image in all viewport sizes.

TIP: Test responsiveness with Chrome Developer Tools device emulation by right-clicking anywhere on page, selecting 'Inspect Element', clicking the rectangle to the left of the Elements tab, select Apple iPad or Google Nexus 5 from Device drop-down list, and click reload.

Great job with responsive UI and app is usable across all devices! 🌟

Featured Work

Portfolio

<https://github.com/xuwenzhe/build-a-portfolio-site>

Leetcode

<https://github.com/xuwenzhe/leetcode>

Selfnotes

<https://github.com/xuwenzhe/selfnotes>

All content is rendered on all three devices. No content should be hidden on mobile devices.

Viewport `meta` tag is included in `HTML` . (i.e. `<meta name="viewport" ... >`)

If a CSS framework is used, classes provided by the CSS framework are used to make images responsive, otherwise media-queries are used to ensure responsiveness of images.

Separation of Concerns

Portfolio completely separates structure (`HTML`) from design/style (`CSS`). There are no `style` attributes present in the body of the `HTML` document. There are no `<style>` elements in the document.

Note: It is acceptable to include `height` and `width` attributes in `` elements.

Files are organized with a directory structure that separates files based on functionality. For example:

`css/` for stylesheets
`img/` for images
`js/` for JavaScript files

Code Quality

- All code (`HTML` element names, attributes, attribute values) is lowercase (except `text/CDATA`).
- Code does not have trailing white spaces.
- Indentation is consistent (either all tabs or all 2 spaces or all 4 spaces etc).
- Code uses a new line for every block, list or table element and indent every such child element (it's acceptable to put all `` elements in one line).
- [Optional] When quoting attribute values, code uses double quotation marks.

- `HTML` documents use `HTML5` `<!doctype html>` .

- Code passes `HTML` and `CSS` validators.
- *[Optional] Code does not use entity references unless necessary e.g. characters with special meaning in `HTML` (like `<` and `&`) as well as control or “invisible” characters (like no-break spaces).
- [Optional] Code omits type attributes for style sheets and scripts.

- Code does not have trailing white spaces.
- Indentation is consistent (either all tabs or all 2 spaces or all 4 spaces etc).
- Code indents all block content, that is rules within rules as well as declarations to reflect hierarchy and improve understanding.
- Code uses a semicolon after every declaration for consistency and extensibility reasons.
- Code always uses a space after a property name's colon, but no space between property and colon, for consistency reasons.
- Code always use a single space between the last selector and the opening brace that begins the declaration block.
- Code always start a new line for each selector and declaration.
- Code always put a blank line (two line breaks) between rules.
- [Optional] Code uses double quotation marks for attribute selectors or property values. Do not use quotation marks in `URI` values (`url()`).

- Code uses meaningful or generic ID and class names that are as short as possible but as long as necessary.
- Code does not use element names in conjunction with IDs or classes.
- Code uses shorthand properties where possible.
- [Optional] Code omits unit specification after 0 values.
- [Optional] Code includes leading 0s in decimal values for readability.
- [Optional] Code uses 3-character hexadecimal notation where possible.
- [Optional] Code separate words in ID and class names by a hyphen.
- [Optional] Code avoids user agent detection as well as `CSS` “hacks”—try a different approach first.

- `HTML` templates and documents use `UTF-8` encoding. (no `BOM`) i.e. `<meta charset="utf-8">` .
- *[Optional] Mark todos and action items with `TODO`
